This paper forms the substance of a course of lectures given at the International Summer School in Computer Programming at Copenhagen in August, 1967. The lectures were originally given from notes and the

paper was written after the course was finished. In spite of this, and only partly because of the shortage of time, the

paper still retains many of the shortcomings of a lecture course. The chief of these are an uncertainty of aim—it is

never quite clear what sort of audience there will be for such lectures—and an associated switching from formal

to informal modes of presentation which may well be less acceptable in print than it is natural in the lecture room.

For these (and other) faults, I apologise to the reader.

There are numerous references throughout the course to CPL [1–3]. This is a programming language which has

been under development since 1962 at Cambridge and London and Oxford. It has served as a vehicle for research

into both programming languages and the design of compilers. Partial implementations exist at Cambridge and

London. The language is still evolving so that there is no definitive manual available yet. We hope to reach another

resting point in its evolution quite soon and to produce a compiler and reference manuals for this version.

The

compiler will probably be written in such a way that it is relatively easy to transfer it to another machine, and in

the first instance we hope to establish it on three or four machines more or less at the same time.

The lack of a precise formulation for CPL should not cause much difficulty in this course, as we are primarily

concerned with the ideas and concepts involved rather than with their precise representation in a programming

language.
